AUTHOR: Jaworska, Bogumila; Strauch, Edward; Walczewski, Jacek

TITLE: Techniques for investigating the structure of clouds by means of aircraft

SOURCE: Przegląd geofizyczny, no. 2, 1964, 157-172

TOPIC TAGS: cloud structure, cloud seeding, aerological instrumentation, aircraft cloud seeding, cloud seeding explosive

ABSTRACT: The present state of research on cloud structure conducted since 1961 by the Aerological Division of the State Institute of Hydrology and Meteorology (Poland) is discussed at length. Methods used operationally by the Division for aircraft observation of the drop spectrum and liquid water content of clouds are described, as are the measuring instruments designed in the Institute's workshops. In measuring drop spectrum, samples of water drops are taken from the clouds by means of a glass platelet coated with an oil film. The liquid water content of clouds is measured by the trace method, which consists in collecting falling cloud drops on filter paper coated with a dye which dissolves in water but does not react to the water vapor.

ACCESSION NO: AP4042065

In the atmosphere. Two models of a device for measuring liquid water were designed: one for use with Li-2 aircraft and single-engine planes of the CSS-13 or Yak-12 type. The article also describes devices used for cloud seeding designed by the Rocket Sounding Division of the Institute. They include a device for ejecting reagents from a balloon, a "condensation grenade" (i.e. an explosive charge suspended from the balloon), a device for ejecting small charges from CSS-13 aircraft, and a RASKO-1 rocket used to introduce a catalytic substance (gunpowder-silver iodide mixture) into fully developed thunderstorms and hail clouds (see Figs. 1-3 of the Enclosure). Orig. art. has: 19 figures, 1 table, and 2 formulas.

Treszczanowicz E. Jaworska I. Synthesis of Diethylamine from Acetaldehyde, Hydrogen and Ammonia.

"Synteza dwuetylaminy z aldehydu octowego, amoniaku i wodoru", Przemysl Chemiczny, No. 11, 1950, pp. 680-683, 5 figs., 6 tabs.

Comparative tests of preparing diethylamine from acetaldehyde, hydrogen and ammonia under atmospheric pressure are described. The synthesis is carried out by continuous method in the presence of two catalysts: $\text{Ni}(\text{Al}_2\text{O}_3)_2$ in pieces and $\text{Ni}(\text{Cr}_2\text{O}_3)$ adsorbed on phospor. The overall synthetic reaction was examined. The effect of the following factors upon the reaction was investigated: 1) temperature (150.-200°), 2) rate of the substrate flow (time of contact is ca. 0.5-5 sec.), 3) the ammonia excess in substrate, 4) application of silica sol (from technical water glass purified by means of an

"lonite") as the agent to facilitate the catalyst deposition on porous. A stability test, covering 200 hours, of $\text{Ni}(\text{Al}_2\text{O}_3)_2$ catalyst was made.

TITLE:

'Acidity' of aluminosilicate catalysts and methods for its determination as a means of estimating their catalytic activity

PERIODICAL:

Wiadomości chemiczne, no. 7, 1962, 449 - 464.

TEXT:

A review is presented of the chemical surface properties ('acidity') of the above catalysts, (including allied substances and mixtures of compounds of Al and Si), based on Soviet and Western works. The work was produced in view of the importance of the acidity in estimating the catalytic activity in e.g. cracking, polymerization and isomerization reactions. The acidity depends largely on composition, preparation and subsequent treatment of the catalysts. Ranges of composition are quoted and the preparation and activation procedures are discussed. Theories concerning the structure and action of the above catalyst are described; the active localities are believed to be proton or

Card 1/3

'Acidity' of aluminosilicate catalysts ... P/016/62/000/007/001/001
D204/D307

electron-pair acceptor centers. Examples of the dependences of activity on the acidity are given, followed by a description of methods used for determining the latter property. These include (a) measuring the acidity of aq. suspensions of the catalysts, e.g. by the measurement of CO_2 evolved on adding Na_2CO_3 or the rate of inversion of saccharose, by exchanging the cations adsorbed on the catalyst with basic ions, following this by estimation of excess alkali, by potentiometric titrations, pH measurements, gradual poisoning of the catalyst with alkali followed by extrapolation to zero activity, and (b) measuring the acidity in non-aqueous media, by titration of the suspensions in benzene with n-butylamine, by determining the adsorption of basic gases and vapors at various temperatures, and, (for aprotic acidity only) by measuring the rise in temperature of a benzene suspension of the catalyst on gradual addition of 1N solutions of Lewis acids in benzene. There are 67 references: 24 Soviet-bloc and 43 non-Soviet-bloc.

„Badania nad kontaktowym utlenianiem mieszaniny 3- i 4-pikoliny powietrzem w obecności amoniaku”. Przemysł Chemiczny, No. 7, 1958, pp. 484-489, 8 figs., 5 tabs.

This paper deals with the preliminary examination of the process of contact oxidation of a 3- and 4-picoline mixture with air in the presence of ammonia. The reaction was carried out in gaseous phase over a contact of vanadium oxides on alumina carrier. The product obtained was a mixture of nitriles of nicotinic and isonicotinic acids. The yield of nitriles at 330-360° was about 63% of the theoretical in relation to the picolines introduced, and 90% to the picolines which entered into reaction. Only 0.0% of the picolines introduced suffered oxidation with decomposition.

The condensation was investigated of triethyl phenylethylene- and -phenylethane tricarboxylate with urea in heated sodium ethylate solution. In both cases, there was formation of the same compound (a far better yield in the case of the saturated ester) to which was attributed the formation of 5(α -carbamidobenzyl)-barbituric acid.

Oblique Plate under Shear

1955

A. Jęzowski

Poland

The solution of the problem has been obtained by using the energy method. The oblique coordinate system has been introduced, in which the terms of the potential energy of the plate have been obtained, namely the components of the energy stored by bending and by the action of external forces. AUTHOR: Jaworski, Andrzej (Warsaw)

TITLE: Stress analysis of thin-walled structures with flexible ring stiffeners, subjected to concentrated loads

PERIODICAL: Archiwum budowy maszyn, v.7, no.2, 1960, 151-197

TEXT: This paper provides the stress analysis for axially symmetric double curvature, ellipsoidal and paraboloidal shells reinforced by flexible ring stiffeners constituting monocoque structures such as used for aircraft fuselages or pressure vessels where the interaction between the ring stiffeners and the shell is taken into account. The analysis assumes the external forces applied to the rings to act in the planes of the rings which are of small curvature. The sheet covering is considered as a shell in the membrane state of stress. The

Stress analysis of thin-walled ...

interaction between the shell and the ring is represented by the Fourier series for the shear flow Eq.(5)

$$S_x = \frac{1}{2} S_{x,0} + \sum_{m=1}^{\infty} S_{x,m}^s \sin m\beta + S_{x,m}^c \cos m\beta .$$

for which the amplitudes of the zero and first harmonics are found from equilibrium equations. Harmonics of higher order, constituting the statically indeterminate reactions are found by Maxwell-Mohr equations, for which a simplification is provided by using the method of group unknowns. The practical application of the stress analysis described in this paper is shown by solving a numerical example for an aluminium free ring-shell structure consisting of 4 paraboloid type bays and 4 elliptical type ones stiffened by 9 evenly spaced rings of constant section. The structure is subjected to the action of 4 external forces applied in the planes of the rings. Using

Card 2/3

Stress analysis of thin-walled ... P/032/60/007/002/001/003
D 259/D304

the method of calculation described in this paper, the values for the resultant stresses are found for each section of the structure and the results are plotted against the experimental data obtained from strain-gauge measurements. In a series of graphs sufficiently close accuracy of the computation method with the actual stresses is shown. The advantage of this method lies in the convergency of results enabling sufficiently close results to be obtained by considering a few of the first harmonics only for certain types of loading. P/0053/63/000/004/0209/0216

AUTHOR: Jaworski, Czeslaw

TITLE: Determination of trace impurities in inert gases

SOURCE: Przegląd elektroniki, no. 4, 1967, 209-216

TOPIC TAGS: colorimetric oxygen determination, automatic analyzer, colorimetry, trace impurity, inert gas

ABSTRACT: Electronics requires extremely pure gases devoid of oxygen or water vapor particularly in the field of semiconductors. Successful purification -- usually by reducing the oxygen to water over a catalyst and absorbing the formed water on a drying agent -- depends on the sensitivity of the means available to determine these traces. Most reliable are automatic registering analyzers; the author describes the operation of the Magnos (Hartmann-Braun), Hersch (Engelhard) analyzers for oxygen determination, and the Taylor (Cranshaw-Davidson modif.) electrolytic hydrometer. He then describes a simple colorimetric method for the determination of traces of oxygen to be used in the absence of an analyzer or to supplement it. This method employs the known oxidation of colorless cuprous chloride to give a blue compound, where the

Card 1/4

L 18295-63
ACCESSION NR: AP3003180

intensity of color is a function of the oxygen concentration. Setup to prepare the analytical reagent (30 g CuCl, 90 g NH₄Cl in 2.5 l of boiled distilled water and 375 ml of 25% NH₄OH, under nitrogen) is shown in Figure 2 of Enclosure 2, and the apparatus for passing the tested gas into this reagent and filling the colorimetric cell for determination with an FEKM photoelectrocolorimeter and red filter is shown in Figure 1 of Enclosure 1. The standard curve and chart for reading the oxygen concentration, and a formula for the alternate determination of the oxygen by titration with CuSO₄ solution are given. The method is applicable for oxygen concentrations in inert gases of 0.0003-0.01%, about 3% error for concentrations over 0.001% and up to 10% for lower concentrations.
